This article aims to explore the fundamentals of the combined gas law, present detailed solutions, and provide tips for solving related problems effectively.

Fundamentals of the Combined Gas Law

What Is the Combined Gas Law?

The combined gas law expresses the relationship between pressure (P), volume (V), and temperature (T) for a fixed amount of gas when these variables change. It is derived from the individual gas laws:

- Boyle's Law: $(P_1V_1 = P_2V_2)$ (at constant temperature)
- Charles's Law: $(\frac{V_1}{T_1} = \frac{V_2}{T_2})$ (at constant pressure)
- Gay-Lussac's Law: $(\frac{P_1}{T_1} = \frac{P_2}{T_2})$ (at constant volume)

By combining these, the law is expressed as:

$$PV/T = \text{constant}$$

which leads to the combined gas law formula:

$$\frac{P_1V_1}{T_1} = \frac{P_2V_2}{T_2}$$

$$\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2}$$

\]

where:

- (P_1, V_1, T_1) are the initial pressure, volume, and temperature
- (P_2, V_2, T_2) are the final pressure, volume, and temperature

Note: Temperatures must be in Kelvin for calculations.

Importance of the Answer Key for Combined Gas Law

The answer key provides step-by-step solutions to typical problems involving the combined gas law. It helps students verify their work, understand problem-solving techniques, and grasp the conceptual relationships among variables. Having access to well-structured answer keys enhances learning efficiency and confidence in tackling gas law problems.

Sample Problems with Answer Keys for Combined Gas Law

Example 1: Changing Pressure and Volume at Constant Temperature

Problem: A gas occupies a volume of 10.0 L at a pressure of 1.00 atm and a temperature of 300 K. If the pressure is increased to 2.00 atm while keeping the temperature constant, what is the new volume?

Solution:

- Identify variables:

- Initial: $(V_1 = 10.0\text{ L})$, $(P_1 = 1.00\text{ atm})$, $(T_1 = T_2 = 300\text{ K})$

- Final: $(P_2 = 2.00\text{ atm})$, $(V_2 = ?)$

- Use the combined gas law:

$$\left[\right.$$

$$\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2}$$

$$\left. \right]$$

Since $(T_1 = T_2)$, the temperatures cancel out:

$$\left[\right.$$

$$P_1 V_1 = P_2 V_2$$

$$\left. \right]$$

$$\left[\right.$$

$$V_2 = \frac{P_1 V_1}{P_2} = \frac{1.00\text{ atm} \times 10.0\text{ L}}{2.00\text{ atm}} = 5.00\text{ L}$$

$$\left. \right]$$

Answer:

The new volume is 5.00 liters.

Example 2: Temperature and Volume Change at Constant Pressure

Problem: A gas occupies 15.0 L at 300 K and a pressure of 1 atm. If the temperature is increased to 400 K, and the volume expands to 20.0 L, what was the initial pressure?

Solution:

- Identify variables:

- Initial: $(V_1 = 15.0\text{ L})$, $(T_1 = 300\text{ K})$, $(P_1 = ?)$

- Final: $(V_2 = 20.0\text{ L})$, $(T_2 = 400\text{ K})$, $(P_2 = 1\text{ atm})$

- Use the combined gas law:

[

$$\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2}$$

]

Rearranged for (P_1) :

[

$$P_1 = \frac{P_2 V_2 T_1}{V_1 T_2}$$

]

Plugging in the values:

[

$$P_1 = \frac{1\text{ atm} \times 20.0\text{ L} \times 300\text{ K}}{15.0\text{ L} \times 400\text{ K}} = \frac{6000}{6000} = 1\text{ atm}$$

]

Answer:

Answer Key for Combined Gas Law: A Comprehensive Guide for Students and Enthusiasts

Understanding the behavior of gases under varying conditions is fundamental in fields ranging from chemistry and physics to engineering and environmental science. Among the various principles that describe gas behavior, the combined gas law stands out as a crucial concept that integrates Boyle's, Charles's, and Gay-Lussac's laws into a single, unified formula. Mastering the answer key for the combined gas law not only simplifies problem-solving but also deepens comprehension of how gases respond to changes in pressure, volume, and temperature. This article provides a detailed exploration of the combined gas law, including its derivation, key concepts, example problems, and tips for mastering its application.

What Is the Combined Gas Law?

The combined gas law is a fundamental relation that describes how the pressure (P), volume (V), and temperature (T) of a fixed amount of gas change in relation to each other when no gas is added or removed from the system. It combines three well-known gas laws:

- Boyle's Law: At constant temperature, pressure and volume are inversely proportional.
- Charles's Law: At constant pressure, volume and temperature are directly proportional.
- Gay-Lussac's Law: At constant volume, pressure and temperature are directly proportional.

By integrating these relationships, the combined gas law provides a comprehensive formula:

$$(P_1 \times V_1) / T_1 = (P_2 \times V_2) / T_2$$

Where:

- P_1 and P_2 are the initial and final pressures,
- V_1 and V_2 are the initial and final volumes,
- T_1 and T_2 are the initial and final temperatures (measured in Kelvin).

This equation allows scientists and students to predict how changing one or more variables affects the others, making it an essential tool in gas law calculations.

Derivation and Conceptual Foundations

The combined gas law can be derived by combining Boyle's, Charles's, and Gay-Lussac's laws mathematically. Let's briefly explore how this integration occurs:

- Boyle's Law:

$$(P \propto \frac{1}{V}) \text{ (at constant temperature)}$$

$$(\rightarrow PV = \text{constant})$$

- Charles's Law:

$$(V \propto T) \text{ (at constant pressure)}$$

$$(\rightarrow \frac{V}{T} = \text{constant})$$

- Gay-Lussac's Law:

$$(P \propto T) \text{ (at constant volume)}$$

$$(\rightarrow \frac{P}{T} = \text{constant})$$

By combining these proportionalities, the law considers all three variables simultaneously, leading to

the formula:

\[

$$\frac{P V}{T} = \text{constant}$$

\]

For a gas sample undergoing a change, the initial and final states relate as:

\[

$$\frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2}$$

\]

This equation is the backbone of the answer key for the combined gas law, enabling precise calculations in various scenarios.

Understanding the Combined Gas Law

The combined gas law is a fundamental principle in chemistry that relates the pressure, volume, and temperature of a fixed amount of gas. It essentially combines three individual gas laws—Boyle's Law, Charles's Law, and Gay-Lussac's Law—into a single comprehensive equation. This law allows us to predict how changes in one or more of these variables affect the others when the amount of gas remains constant.

Historical Context and Importance

Before diving into the specifics, it's important to recognize the historical development of gas laws:

- Boyle's Law: Describes the inverse relationship between pressure and volume at constant temperature.
- Charles's Law: Explains the direct relationship between volume and temperature at constant pressure.
- Gay-Lussac's Law: Details the direct relationship between pressure and temperature at constant volume.

The combined gas law synthesizes these relationships, providing a more versatile tool for solving real-world problems where multiple variables change simultaneously.

The Combined Gas Law Formula

The combined gas law is expressed mathematically as:

$$(P_1 \times V_1) / T_1 = (P_2 \times V_2) / T_2$$

where:

- P_1 and P_2 are the initial and final pressures,
- V_1 and V_2 are the initial and final volumes,
- T_1 and T_2 are the initial and final temperatures (measured in Kelvin).

This equation states that the ratio of the product of pressure and volume to temperature remains constant for a fixed amount of gas during any process involving simultaneous changes in these variables.

Key Points to Remember

- Temperatures must always be in Kelvin when using the combined gas law.
- The amount of gas (moles) remains constant; otherwise, the law does not apply.
- It's useful for solving problems where pressure, volume, and temperature change simultaneously.

Applications of the Combined Gas Law

The combined gas law has broad applications in various fields such as:

- Laboratory experiments: Predicting how gases behave under different conditions.
- Engineering: Designing systems involving pressurized gases.
- Meteorology: Understanding atmospheric pressure and temperature variations.
- Everyday life: Explaining phenomena like the expansion of a balloon in the heat or the compression of gases in a syringe.

$$P_2 = 2.00 \text{ atm}$$

$$T_2 = 75^\circ\text{C} = 348.15 \text{ K}$$

$$V_2 = ?$$

- Apply the formula:

$$(P_1 \times V_1) / T_1 = (P_2 \times V_2) / T_2$$

- Plug in values:

$$(1.00 \text{ atm} \times 10.0 \text{ L}) / 298.15 \text{ K} = (2.00 \text{ atm} \times V_2) / 348.15 \text{ K}$$

- Solve for V_2 :

$$V_2 = (1.00 \text{ atm} \times 10.0 \text{ L} \times 348.15 \text{ K}) / (2.00 \text{ atm} \times 298.15 \text{ K})$$

$$V_2 = (10.0 \times 348.15) / (2.00 \times 298.15)$$
